

## A course in electrical engineering Volume 2

Filesize: 9.72 MB

### ***Reviews***

*Absolutely essential study publication. Sure, it is enjoy, nonetheless an amazing and interesting literature. I realized this book from my dad and i suggested this pdf to find out.*  
*(Justus Abbott)*

## A COURSE IN ELECTRICAL ENGINEERING VOLUME 2

To save **A course in electrical engineering Volume 2** PDF, you should refer to the link listed below and download the ebook or gain access to additional information which are related to A COURSE IN ELECTRICAL ENGINEERING VOLUME 2 ebook.

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 140 pages. Dimensions: 9.7in. x 7.4in. x 0.3in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1922 Excerpt: . . . the secondary and primary resistances, respectively, as a one-to-one ratio of rotor to stator turns is assumed. Line PG is then drawn. At any load current  $I_2$  ( $I_{PE}$ ) is the secondary current, being equal to  $I_1$  vectorially. EA is the energy component of the current  $I_1$ , and therefore the total power input per phase,  $P_i = E_a I_1$ . The core and friction losses  $P_c = B A X V$  per phase. The primary copper loss  $i_1^2 R_1 = B C X V$  per phase. The secondary copper loss  $I_2^2 R_2 = C D X V$  per phase. The output  $P = D E X V$  per phase. Draw PG parallel to PG and tangent to the circle at E. Break-down torque TB CE (to scale). The above diagram is drawn for but one phase of the motor. The values of power, losses, and torque must be multiplied by  $n$  if the motor has  $n$  phases. The torque scale may be found as follows: The torque is equal to a constant times the power, divided by the speed, the value of the constant depending on the units adopted. The power output per phase is  $P = V X D E$ . The rotor speed  $N_2 = N(1-s)$  where  $N$  is the synchronous speed in r. p. m.  $C D = N(CE - CD) = N^2 CE CE CE$ . The torque developed per phase  $K = CE V X C$  is the total power per phase delivered to the rotor. The total power delivered to the rotor by  $n$  phases,  $P_2 = n \dots$
